## **Burris Tire Recommendations**

- **Cold Weather**
  - Flexing, crushing and/or folding Burris tires in cold conditions (below 32° F) should be avoided.
  - In cold conditions, Burris tires should be warmed to room temperature (approximately 70° F) for several hours before mounting, flexing or unfolding/folding to avoid damage/cracking of the rubber
- **Long Term Tire Storage Recommendations**
  - Burris Tires should be stored in moderate temperatures when not in use
  - Avoid storing tires in trailers over extended periods of time where there will be extreme temperatures (hot or cold)
  - Store in plastic garbage bags or wrap in plastic wrap to minimize exposure to oxygen
  - Keep away from electric motors and power panels
- **Directional Mounting**
  - Burris tires are not directional and can be mounted with either side out
- **Tire Mounting**
  - Tire mounting should be done only by experienced trained personnel using the proper tools and procedures. Failure to follow safe mounting procedures can cause the tire and/or wheel to burst with forces sufficient to cause **SERIOUS PERSONAL INJURY OR DEATH**. Always inspect the tire for possible damage that may have occurred during shipping or storage. Clean the rim and lubricate beads with rubber lubricant. Use a clip on chuck with an in-line valve and pressure gauge or adjustable regulator and remote inflation/deflation device. Have enough air hose to create a safe distance.
